

# AI Dataset Labeling Marketplace — API Contract v2

Generated from the as-built FastAPI OpenAPI contract. The live deployment exposes the same contract at /docs and /openapi.json.

| Method | Path                                               | Summary                                              |
|--------|----------------------------------------------------|------------------------------------------------------|
| GET    | /                                                  | API root                                             |
| GET    | /api/ai/annotations/{annotation_id}/quality        | AI quality report for a submitted annotation         |
| GET    | /api/ai/jobs/{job_id}/insights                     | AI quality insights for a labeling job               |
| POST   | /api/ai/jobs/{job_id}/suggest                      | Suggest a label for a record inside a labeling job   |
| GET    | /api/ai/status                                     | Current AI provider configuration                    |
| GET    | /api/analytics/jobs/{job_id}/progress              | Progress snapshot of one labeling job                |
| GET    | /api/analytics/summary                             | Platform wide workload and quality summary           |
| GET    | /api/annotation-reviews                            | List every quality review                            |
| POST   | /api/annotation-reviews                            | Approve, reject or request revision of an annotation |
| GET    | /api/annotation-reviews/annotation/{annotation_id} | List the review history of an annotation             |
| GET    | /api/annotation-reviews/job/{job_id}               | List the reviews of a labeling job                   |
| DELETE | /api/annotation-reviews/{review_id}                | Delete a quality review (administrator only)         |
| GET    | /api/annotation-reviews/{review_id}                | Retrieve one quality review                          |
| GET    | /api/annotations                                   | List annotations                                     |
| POST   | /api/annotations                                   | Submit a label for an annotation task                |
| GET    | /api/annotations/job/{job_id}                      | List the annotations of a labeling job               |
| GET    | /api/annotations/task/{task_id}                    | List the annotation history of a task                |
| DELETE | /api/annotations/{annotation_id}                   | Withdraw a submitted annotation                      |
| GET    | /api/annotations/{annotation_id}                   | Retrieve one annotation                              |
| PUT    | /api/annotations/{annotation_id}                   | Revise a submitted annotation                        |
| GET    | /api/assignments                                   | List job assignments                                 |
| POST   | /api/assignments                                   | Assign a labeling job to an annotator                |
| GET    | /api/assignments/job/{job_id}                      | List the assignments of a labeling job               |
| GET    | /api/assignments/mine                              | List the assignments of the authenticated annotator  |
| DELETE | /api/assignments/{assignment_id}                   | Delete an assignment                                 |
| GET    | /api/assignments/{assignment_id}                   | Retrieve one assignment                              |
| PUT    | /api/assignments/{assignment_id}                   | Update the status of an assignment                   |
| POST   | /api/auth/login                                    | Authenticate and receive a JWT access token          |
| GET    | /api/auth/me                                       | Return the authenticated user profile                |
| POST   | /api/auth/register                                 | Register a new dataset owner or annotator account    |
| GET    | /api/datasets                                      | Get Datasets                                         |
| POST   | /api/datasets                                      | Create Dataset                                       |
| DELETE | /api/datasets/{dataset_id}                         | Delete Dataset                                       |
| GET    | /api/datasets/{dataset_id}                         | Get Dataset                                          |
| PUT    | /api/datasets/{dataset_id}                         | Update Dataset                                       |
| POST   | /api/datasets/{dataset_id}/upload                  | Upload and parse a dataset file                      |
| GET    | /api/exports/datasets/{dataset_id}                 | Export the labeled records of every job in a dataset |

| Method | Path                        | Summary                                                |
|--------|-----------------------------|--------------------------------------------------------|
| GET    | /api/exports/jobs/{job_id}  | Export the labeled records of a labeling job           |
| GET    | /api/jobs                   | List labeling jobs                                     |
| POST   | /api/jobs                   | Create a labeling job for a dataset                    |
| DELETE | /api/jobs/{job_id}          | Delete a labeling job                                  |
| GET    | /api/jobs/{job_id}          | Retrieve one labeling job                              |
| PUT    | /api/jobs/{job_id}          | Update a labeling job                                  |
| GET    | /api/reviews                | List job reviews                                       |
| POST   | /api/reviews                | Rate a labeling job                                    |
| GET    | /api/reviews/job/{job_id}   | List the reviews of a labeling job                     |
| DELETE | /api/reviews/{review_id}    | Delete a review                                        |
| GET    | /api/reviews/{review_id}    | Retrieve one review                                    |
| PUT    | /api/reviews/{review_id}    | Update a review                                        |
| GET    | /api/tasks                  | List annotation tasks                                  |
| POST   | /api/tasks                  | Create an annotation task inside a labeling job        |
| POST   | /api/tasks/bulk             | Create several annotation tasks at once                |
| POST   | /api/tasks/import-dataset   | Create tasks from uploaded dataset records             |
| GET    | /api/tasks/job/{job_id}     | List the tasks of a labeling job                       |
| GET    | /api/tasks/mine             | List the tasks assigned to the authenticated annotator |
| DELETE | /api/tasks/{task_id}        | Delete an annotation task                              |
| GET    | /api/tasks/{task_id}        | Retrieve one annotation task                           |
| PUT    | /api/tasks/{task_id}        | Update an annotation task                              |
| POST   | /api/tasks/{task_id}/assign | Assign an annotation task to an annotator              |
| GET    | /api/users                  | List every registered user (administrator only)        |
| GET    | /api/users/annotators       | List annotator accounts available for assignment       |
| GET    | /api/users/me               | Return the authenticated user profile                  |
| DELETE | /api/users/{user_id}        | Delete an account (administrator only)                 |
| PATCH  | /api/users/{user_id}/role   | Change the role of an account (administrator only)     |
| PATCH  | /api/users/{user_id}/status | Activate or deactivate an account (administrator only) |
| GET    | /health                     | Liveness probe                                         |

## Contract rules

- All JSON endpoints use the consistent {success, data, message} response envelope.
- Validation is server-side with Pydantic. Successful creates use HTTP 201; client errors use 400/401/403/404/409/422 as appropriate.
- Authentication uses a Bearer JWT. Role checks are enforced on the server.
- Dataset uploads accept CSV, JSON, JSONL and XLSX with bounded file/record limits.
- AI suggestion requests from annotators are tied to an assigned task; human annotation and human review remain the final decisions.
- CSV exports are streamed as files; JSON export previews retain the standard envelope.
